Northbridge Analytics — Platform Release Notes v3.2

Overview

Version 3.2 of the Northbridge Analytics platform introduces real-time anomaly detection, a redesigned dashboard, and expanded API rate limits.

Anomaly Detection

The new anomaly detection module uses a rolling 30-day statistical baseline and flags any metric deviating more than 3 standard deviations from that baseline. Alerts are delivered via email or Slack within 2 minutes of detection.

API Rate Limits

Free-tier API access is now capped at 1,000 requests per hour, up from 500 in v3.1. Enterprise-tier customers have no fixed cap and are instead subject to fair-use monitoring.

Known Issues

Dashboard export to PDF occasionally times out for reports containing more than 50 charts. A fix is scheduled for v3.3, expected in Q3.
